

“Myocarditis, or inflammation of the heart muscle, occurred in **one of 12,361** boys of that age group within a week of receiving a second dose, the study found...the Israeli figure is higher than the Centers for Disease Control and Prevention estimate of **one case per 16,129** vaccinated adolescents aged 12 to 17.”

An Israeli study finds a slightly higher-than-expected rate of heart problems in vaccinated boys.
